

Project Summary – Short Version

Master Album Financiero | Business Intelligence Capstone

Master Album Financiero is a personal Business Intelligence capstone project focused on transforming more than ten years of financial records into a structured, scalable, and insight-driven BI solution.

The project started as an Excel-based tracking system and was redesigned into a full BI architecture. Excel remains the data source, while SQL (PostgreSQL) is used to generate curated datasets consumed directly by Power BI. This approach improves performance, scalability, and maintainability, and mirrors professional BI workflows.

The final Power BI solution includes a current financial dashboard, a historical summary hub, and multiple analytical report pages covering income, expenses, credit, investments, trips, and budget performance. The solution was designed with a strong focus on data modeling, modular DAX measures, clear metric definitions, and intuitive visual storytelling, including a mobile-friendly dashboard.

SQL, Python, and DAX were combined to automate data preparation, reduce manual processes, and ensure consistent analytical logic across refresh cycles. The project emphasizes not only technical implementation, but also usability, documentation, and decision-oriented insights.

The version available for review is a public version of the project, with sensitive information anonymized while preserving the original analytical structure and logic.
